

EXPERIENCES WITH EPI NOUVELLE AT PERIORAL / PERIORBITAL DERMATITIS

Report by Prof.Dr. med. Wolfgang Vanscheidt

PERIORAL / PERIORBITAL DERMATITIS

Perioral / periorbital dermatitis is associated with a great ordeal for the patient. Because of drying and reddening of the skin the patients feel the need to clean the affected areas even more emphatically and provide it with cream and ointments. Consequently they use more cosmetics, thereby strengthening the symptoms. The only way to leave the vicious circle is the renunciation of all care products.

The patient skin should only carry water to flush the affected area and to cool and to reduce the symptoms. The supply of water should thereby be ensured over a longer period.

7-DAY CURE WITH EPI NOUVELLE⁺ NATURELLE

Continuously pure water can be supplied to several hours to the skin with epi nouvelle⁺ naturelle (a natural-based hydro-biopolymer with a water content of up to 99%). Without using cosmetics the treatment with epi nouvelle⁺ naturelle reduces tensioning and itching of the skin, illustrates currents results so far during the user study.

The use of pure water by means of epi nouvelle⁺ naturelle products helps to reduce the symptoms, realized a long-lasting moisturizing and soothing the skin is supported.

APPLICATION PROPOSAL

The epi nouvelle⁺ naturelle "7-day cure" should begin starting from the patient counselling and assessment of the clinical picture of the patient. Recent user study has shown that the patient applies epi nouvelle⁺ naturelle on the affected areas (prepurified with water) for duration up to 2 hours per day.

The "7-day cure" epi nouvelle⁺ naturelle can be repeated, if after a week the symptoms have not subsided in the desired manner.

"The use of epi nouvelle naturelle shows at the application observations very good results."
